

# USB Attack Workshop

Soldering Skills & Basic Keystroke Injection Attacks

[HakCat @ Crash Space]  
Alex Lynd & Angelina Tsuboi 03/19/2023

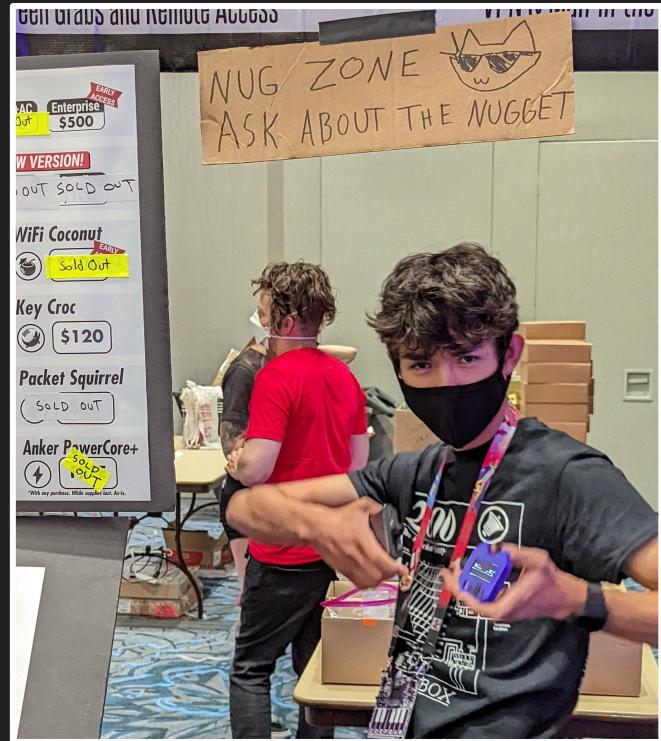

# What we're doing today

-  Learning about USB attacks: methods & tools
-  Soldering your own USB Nugget
-  Writing keystroke injection scripts!

# Alex Lynd

- Hardware Hacker - IOT & Wireless Security
- Content Creator - Hacking Tutorials @ Hak5
- Instructor - I teach & host workshops and stuff

[alexlynd.com](http://alexlynd.com) • [lyndlabs.io](http://lyndlabs.io)

# Angelina Tsuboi

Hi! I'm a software developer and tinkerer interested in hardware, cybersecurity, and mechatronics.

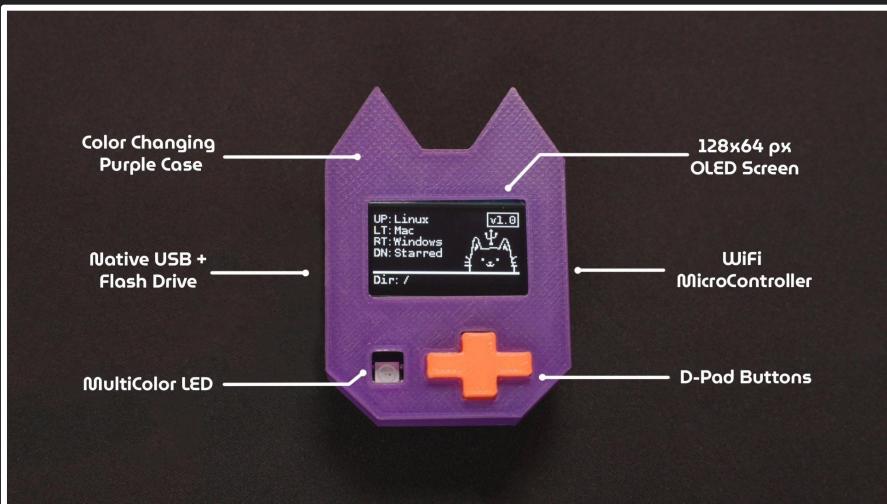

[angelinatsuboi.net](http://angelinatsuboi.net) / @AngelinaTsuboi

# What is the Nugget?

The Nugget is a cat-themed console  
that makes it fun to learn hacking!

- Hardware Prototypes
- CircuitPython
- WiFi Hacking
- USB Hacking

# What is the USB Nugget?

- Run USB Attacks
- Emulate Keyboards & More

## Features:

- DuckyScript
- LED & Screen Feedback
- Flash Drive
- WiFi Interface

# What's under the hood?

The USB Nugget is powered by the **ESP32-S2** microcontroller which offers:

- WiFi (AP & Client mode)
- **Native USB**
  - Emulate USB Devices
  - Flash Storage
- **Easy Hardware Expansion**

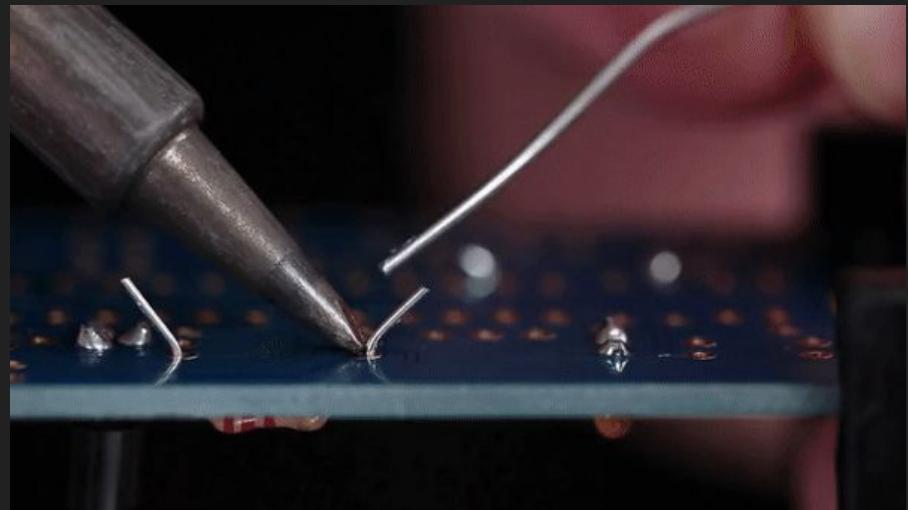

# Soldering Skills Class

Build your own USB Nugget!

# What is Soldering?

Soldering is an assembly technique that lets us mount components on circuit boards.

- Solder is used to attach components to the PCB.
- A soldering iron is used to heat up the circuit board and the components at the same time.
- Solder hardens and lets us create a stable electrical connection.

*Soldering through hole components*

# Common Soldering Tools

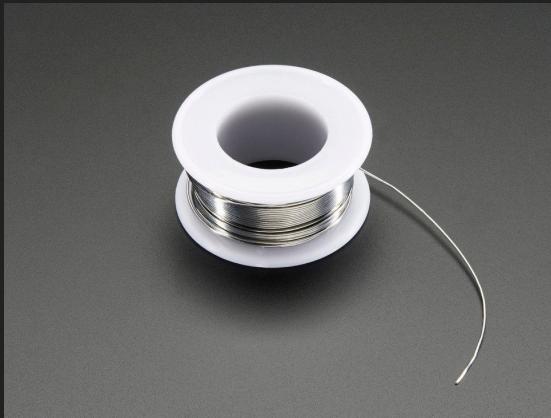

*Soldering Iron*

*Solder Sucker (for screw-ups)*

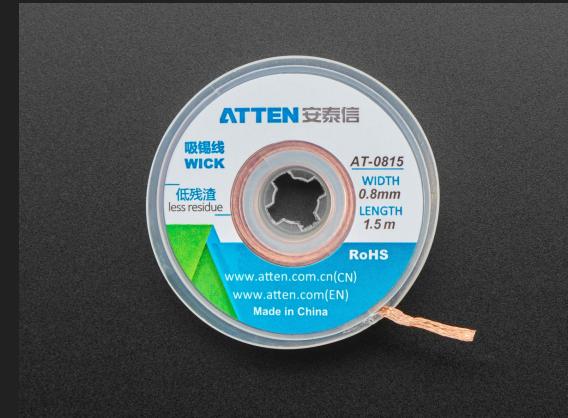

# Soldering Materials

Solder

Solder Flux

Solder Wick

# Soldering techniques

## Through-Hole (THT)

- Hand Assembly
- Big Components

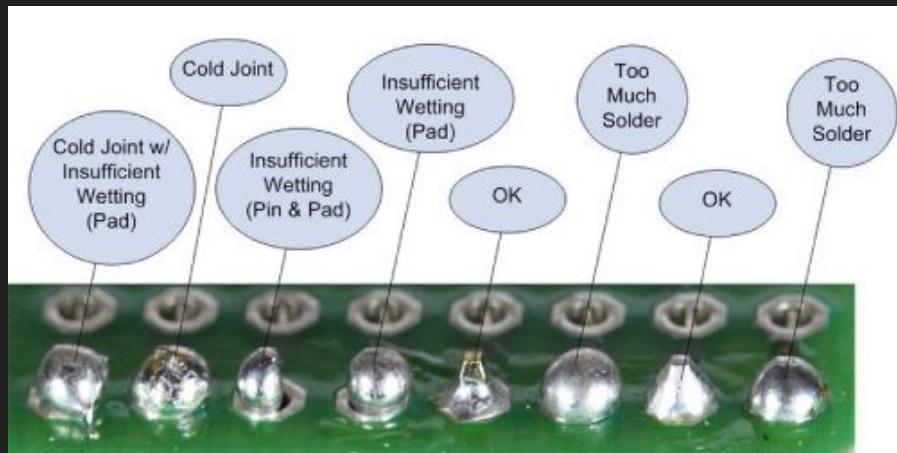

## Surface Mount (SMD)

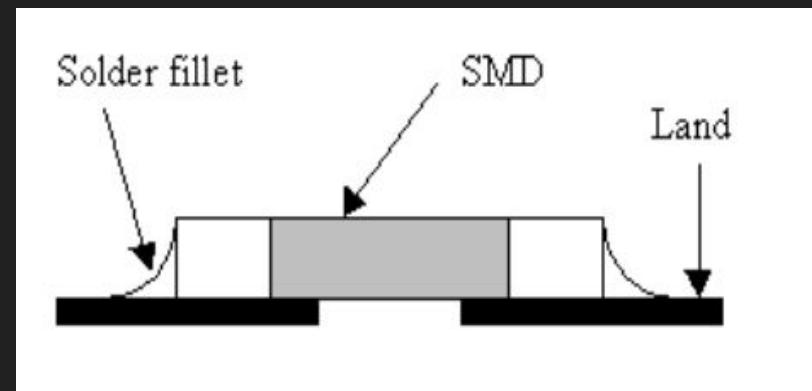

- Cheaper
- Easier for machines

# Good solder joints

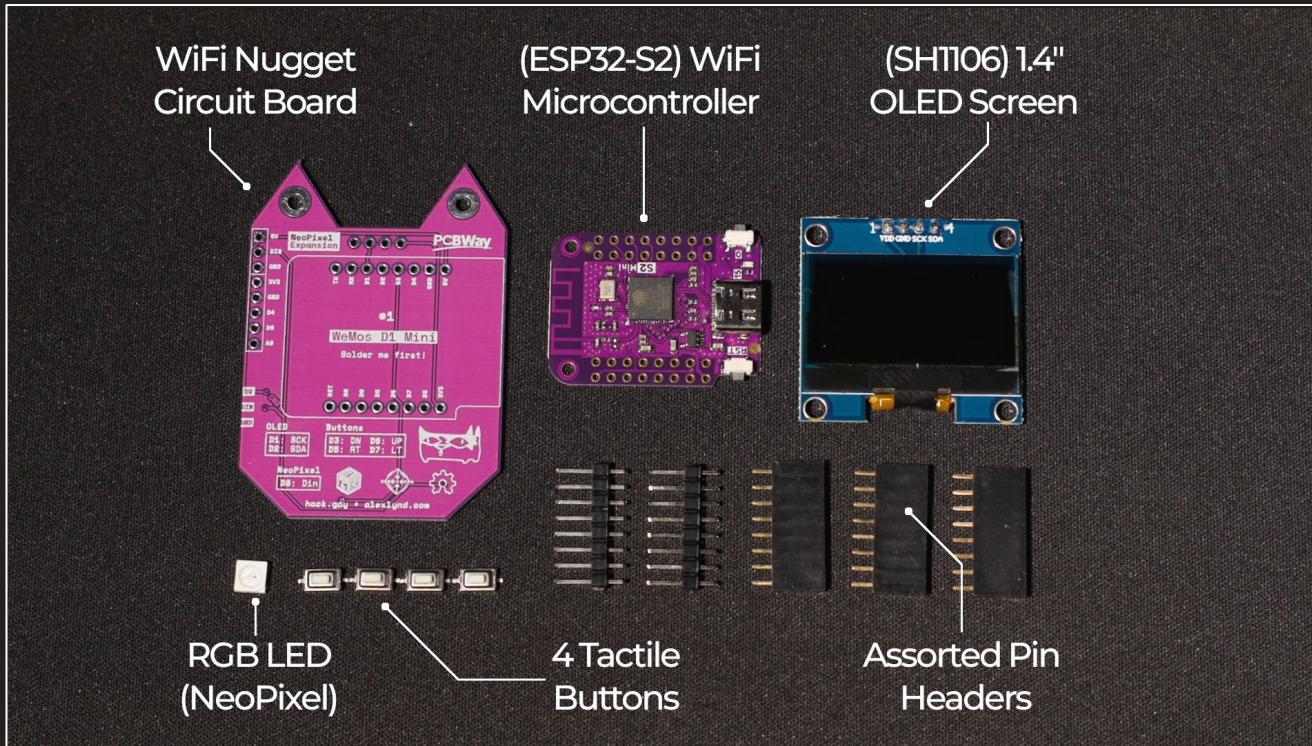

Through-hole joints

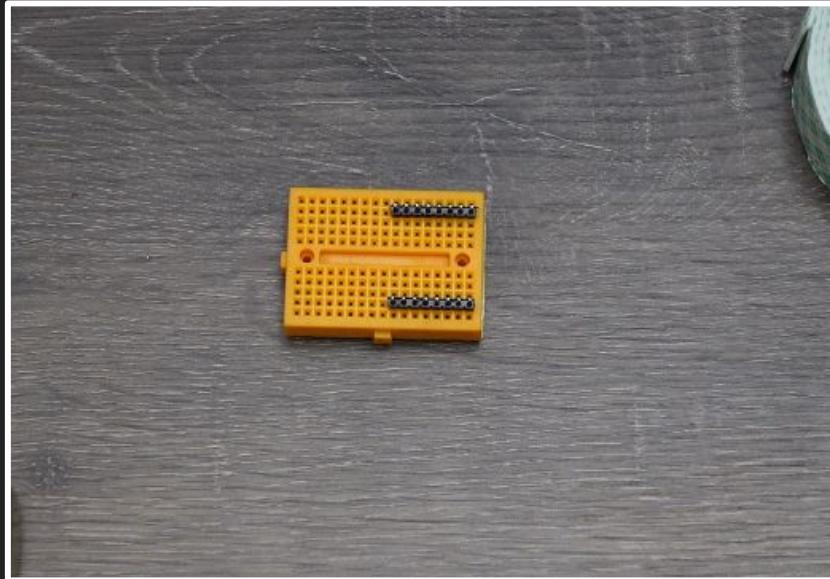

Surface mount pads

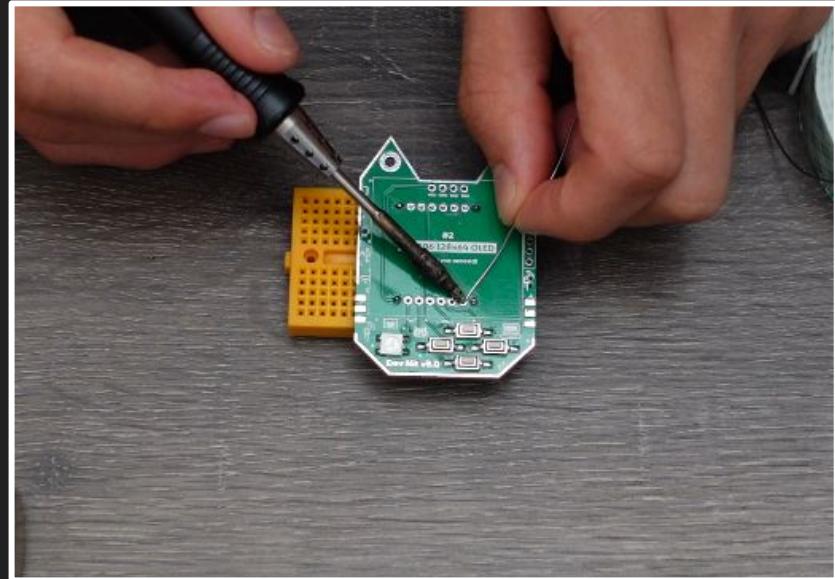

# What's in your Nugget Kit

# 1. Prep the Headers

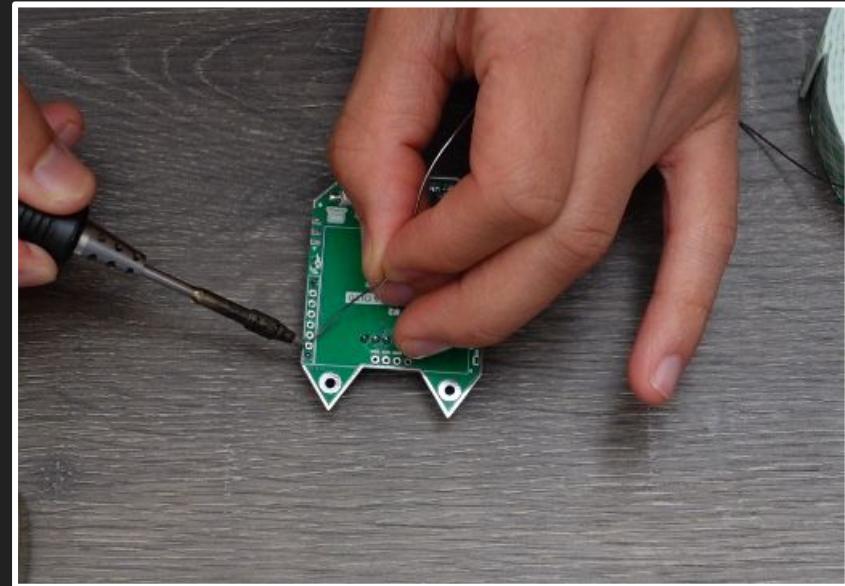

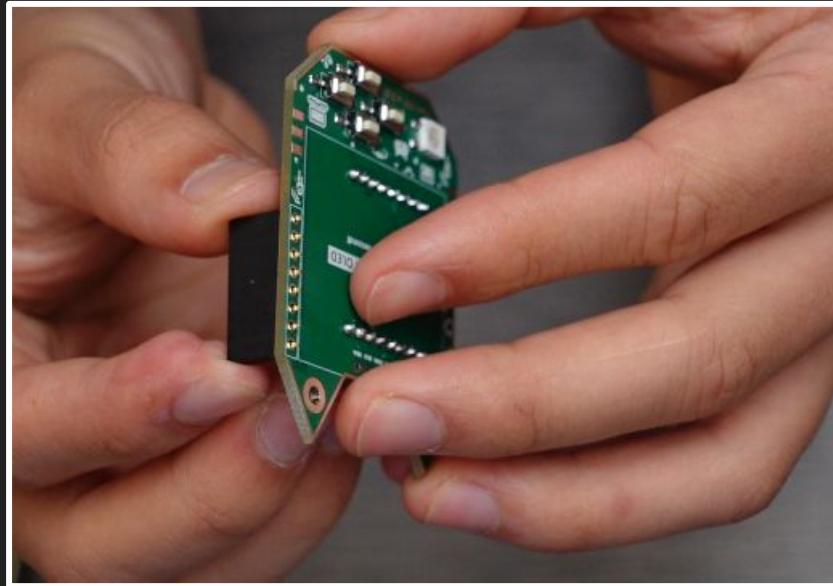

Insert Male Headers Long Side Down

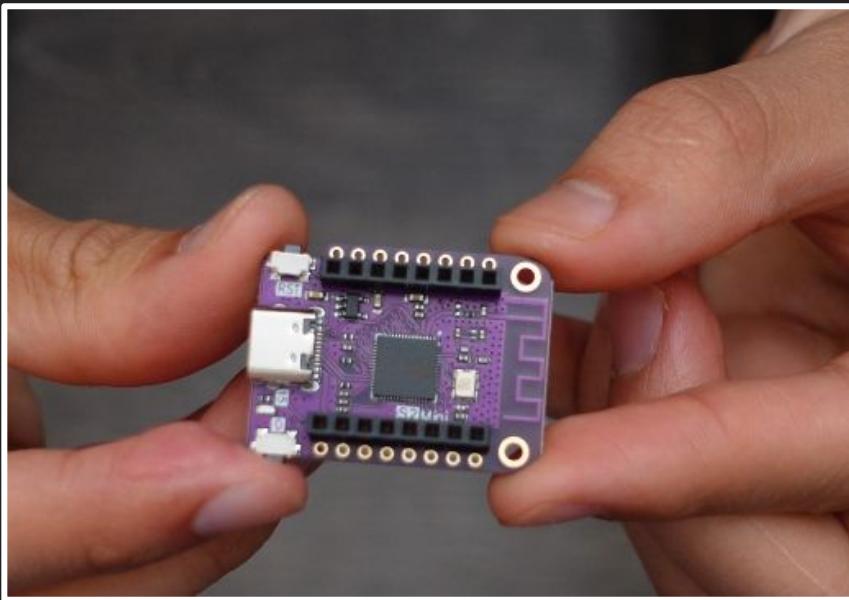

Place Nugget w/ Buttons Facing Up

## 2. Expansion Header

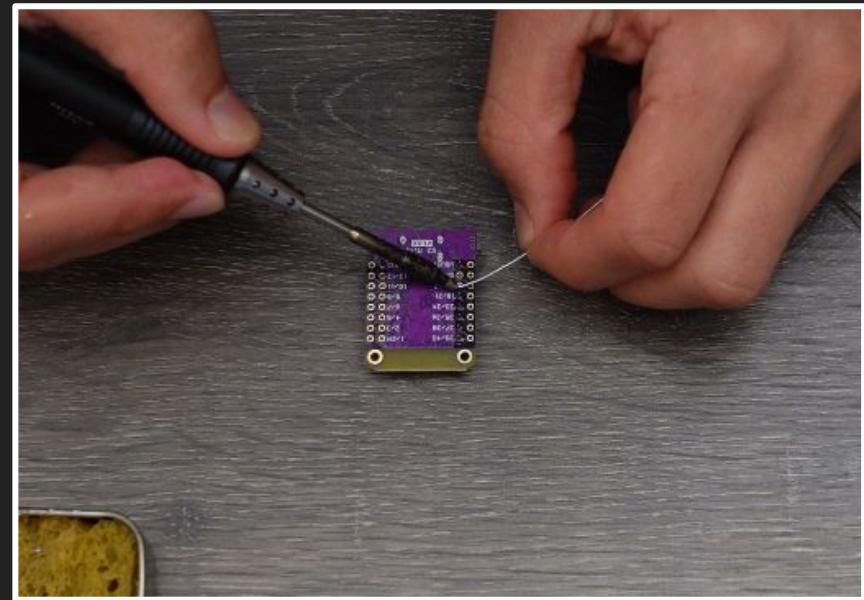

Insert the Long Female Pin Header, and rest the Nugget flush on a flat surface

### 3. Prep the Microcontroller

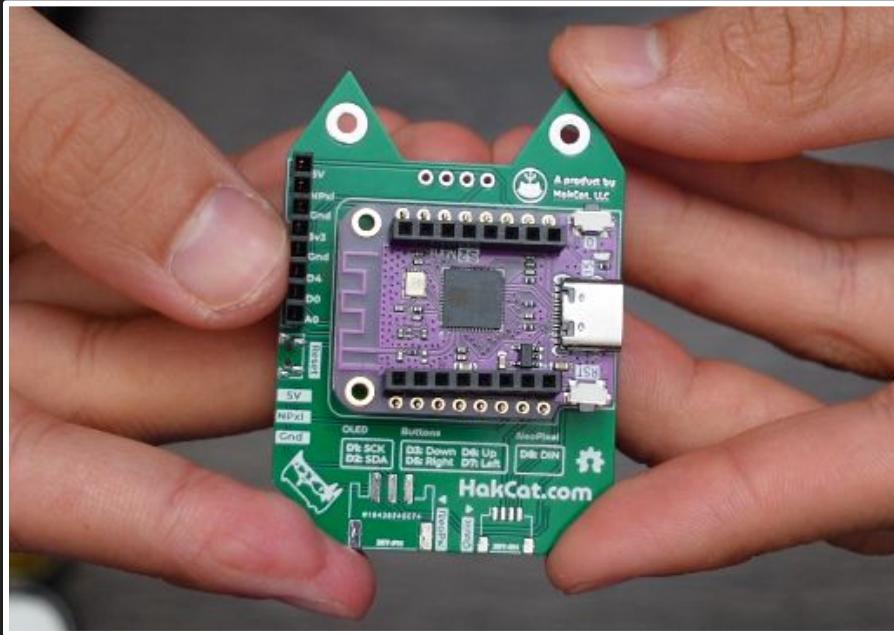

Insert Short Pin Headers on inside rows.

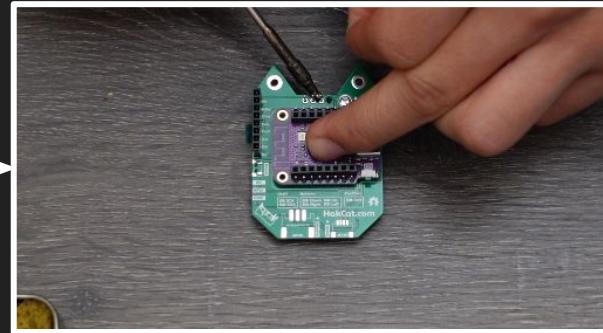

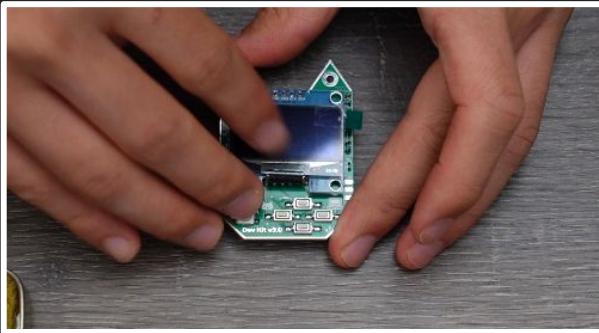

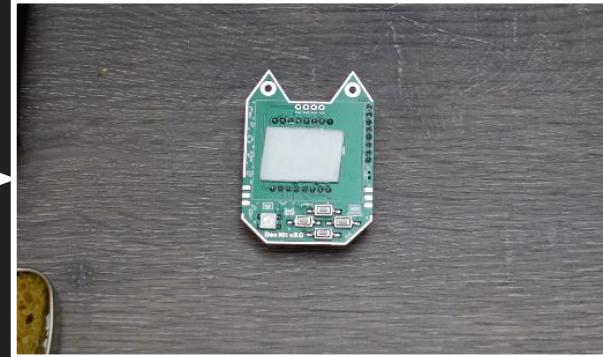

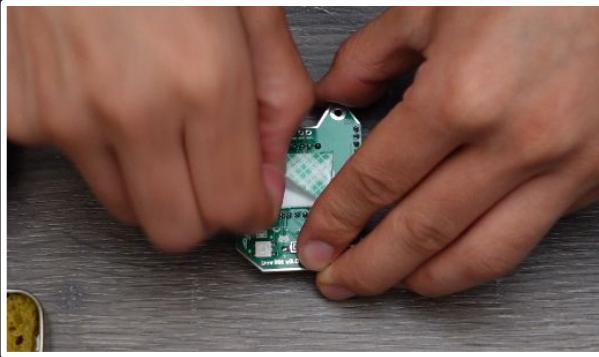

Lie flush on table and solder!

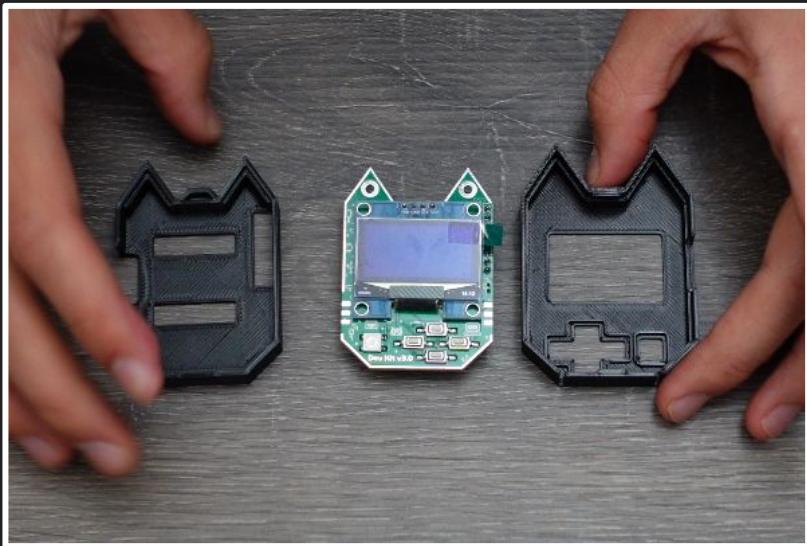

## 4. Solder the Microcontroller

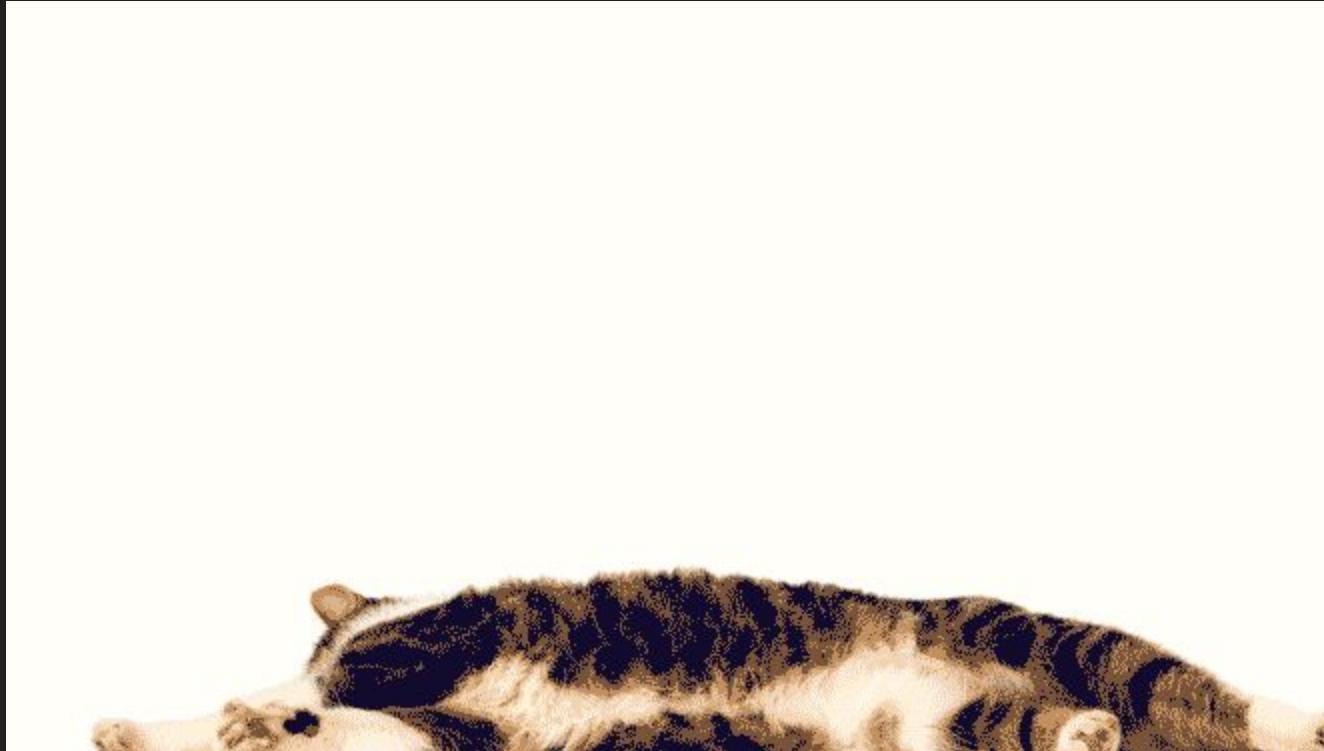

## 5. Mount & Solder the Screen

## 6. Snap on the Case!

# Your Nugget is Ready to Hack!

# **USB Attack Class**

1 Hour

# What are HID Attacks?

Human Interface Device attacks emulate USB devices in order to deliver malicious content to a computer.

HID attacks specifically emulate “trusted” human devices like keyboards.

# What can be emulated?

-  A keyboard can type out pre-programmed malware in seconds.
-  A mouse can move to keep a victim's screen unlocked.
- A usb ethernet adapter can trick computers into re-routing traffic

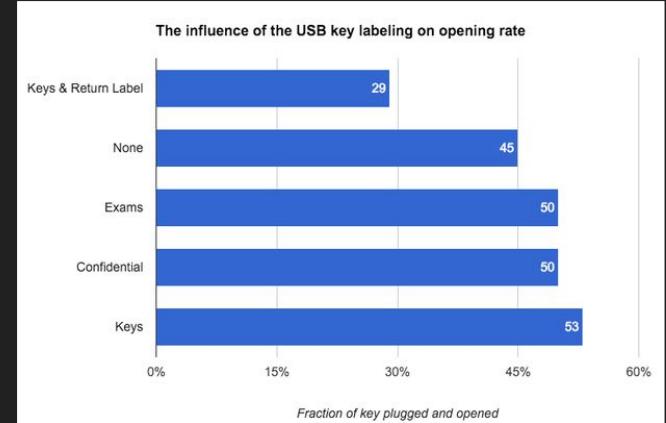

# What are Keystroke Injection Attacks?

- Emulates a keyboards
- Types out pre-programmed commands
- Computers inherently trust keyboards & humans
- Open & navigate programs, download malware, modify & steal files in seconds

# Does this actually work?

- Yes! A study showed that 48% of USB drives left on a university campus were plugged in

## Users Really Do Plug in USB Drives They Find

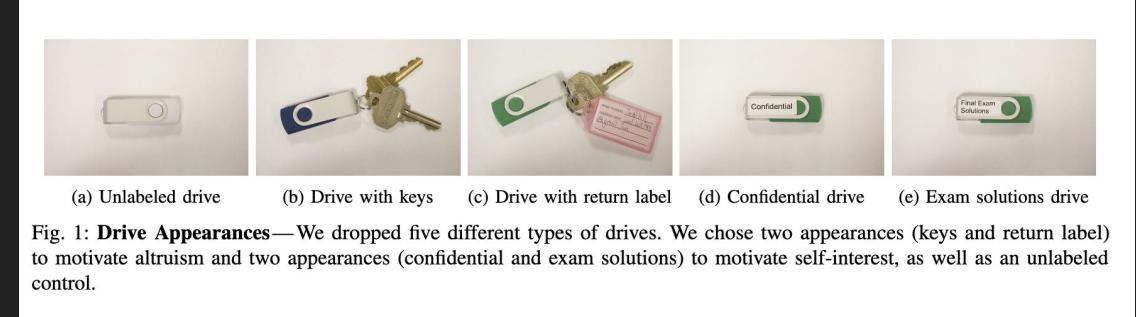

Matthew Tischer<sup>†</sup> Zakir Durumeric<sup>†‡</sup> Sam Foster<sup>†</sup> Sunny Duan<sup>†</sup>  
Alec Mori<sup>†</sup> Elie Bursztein<sup>○</sup> Michael Bailey<sup>†</sup>

<sup>†</sup> University of Illinois, Urbana Champaign <sup>‡</sup> University of Michigan <sup>○</sup> Google, Inc.  
(tischer1, sfoster3, syduan2, ajmori2, mdbaile)@illinois.edu  
zakir@umich.edu elieb@google.com

**Abstract**—We investigate the anecdotal belief that end users will pick up and plug in USB flash drives they find by completing a controlled experiment in which we drop 297 flash drives on a large university campus. We find that the attack is effective with an estimated success rate of 45–98% and expeditious with the first drive connected in less than six minutes. We analyze the types of drives users connect and survey those users to understand their motivation and security profile. We find that a drive's appearance does not increase attack success. Instead, users come in the drive with the alternative intention of finding the owner. These individuals are not technically inclined, but they are rather typical community members who appear to take more recreational risks than their peers. We conclude with lessons learned and discussion on how social engineering attacks—while less technical—continue to be an effective attack vector that our community has yet to successfully address.

### I. INTRODUCTION

The security community has long held the belief that users can be socially engineered into picking up and plugging in seemingly lost USB flash drives they find. Unfortunately,

**Fig. 1: Drive Appearances**—We dropped five different types of drives. We chose two appearances (keys and return label) to motivate altruism and two appearances (confidential and exam solutions) to motivate self-interest, as well as an unlabeled control.

# Real Life Scenario: Fin7

The Fin7 Cybercrime group mailed malicious USB drives that installed ransomware onto targets' computers

- Impersonated Amazon / Health Services / Best Buy etc.
- Social Engineering: enticing packaging
- Fraudulent gift card, thank you letter, USB

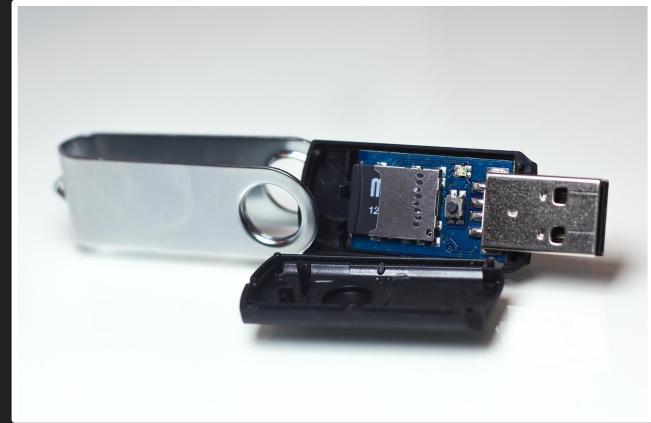

# USB Attack Tools

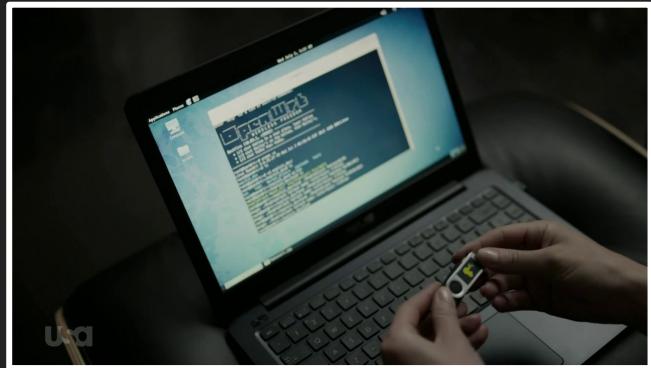

# USB RubberDucky

- First keystroke injection tool, created by Hak5
- Exploded in popularity, featured on shows like Mr. Robot

- Looks like a flash drive!
- Simple scripting language
- Single payload

# DuckyScript

A simple language for scripting keyboard-based HID attacks.

- Line-by-line instructions

## 3 Basic Commands:

- Type Strings!
- Press Key Combos
- Delays or Pauses

## Full Screen Windows 10 Update

```
1 DELAY 3000
2 GUI r
3 DELAY 100
4 STRING https://fakeupdate.net/win10ue/
5 ENTER
6 DELAY 3000
7 F11
```

## USB Rubber Ducky

```
1 ATTACKMODE_HID_VID_0x4AC_FID_0x21E_MANUFACTURER_SERIAL_1337
2 RELEASE_ALL_BUTTONS
3 BUTTON_A_PRESSED
4 ATTACH_TO_STORAGE
5 RELEASE_ALL_BUTTONS
6 RESTORE_PAYLOAD
7 END_BUTTON
8 STORE_PAYLOAD
9 WHILE TRUE
10   $RANDOM_MIN = 1
11   $RANDOM_MAX = 4
12   VAR $A = $RANDOM_INT
13   IF ($A == 1) THEN
14     HOLD_UPARROW
15   ELSE IF ($A == 2) THEN
16     HOLD_UPARROW
17   ELSE IF ($A == 3) THEN
18     HOLD_DOWNARROW
19   ELSE IF ($A == 4) THEN
20     HOLD_DONKASSOM
21   END
22   $RANDOM_MIN = $A
23   $RANDOM_MAX = $A
24   VAR $B = $RANDOM_INT
25   DELAY 50
26   RELEASE
```

Latest DuckyScript 3.0 allows OS detection & programming logic!

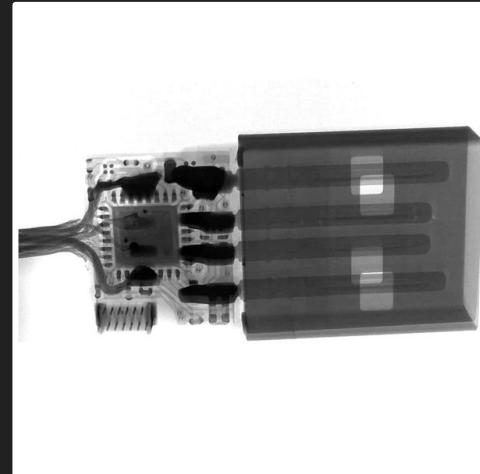

# Bash Bunny

- Flash Storage for Exfiltration
- Emulate Keyboards, Network Devices, and more!
- Bluetooth Geofencing
- Runs Linux
- Chonky

# OMQ Cable

- Looks like a charging cable
- Run attacks over WiFi
  - Geofencing
  - Remote Scripting
- HID Attacks & Keylogging
- Inconvenient to program :(

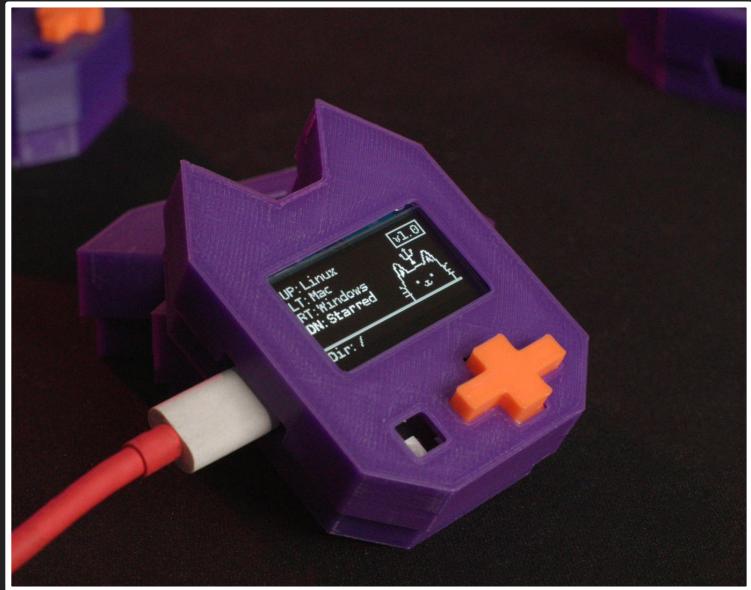

# USB Nugget

- Beginner-focused
- Reactive design
- Easy Debugging

Features:

- Uhh its cute
- Web Interface
- Flash Drive (Payloads & Exfil)

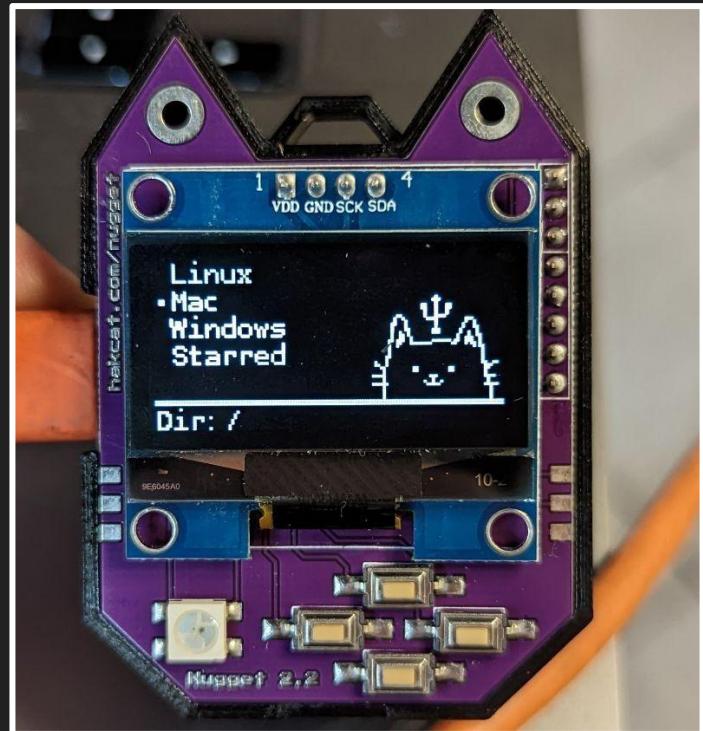

# Hacking with the USB Nugget

1 Hour

# Navigating the Menu

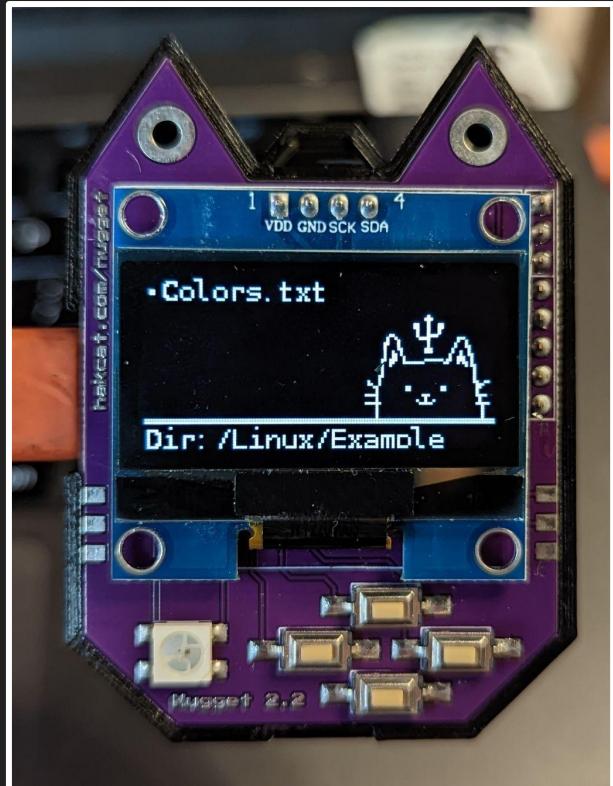

- Up / Down: navigate files & folders
  - Right: select a folder → payload
  - Left: go back
- 
- The current directory is shown at the bottom of the screen

# Running Payloads

Let's test your Nugget!

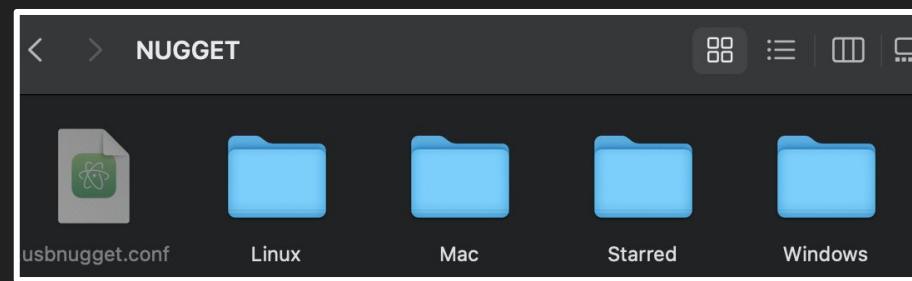

- Select your **Operating System**
- Select the **Example** folder
- Run **colors.txt**.

# Filesystem & Payload Convention

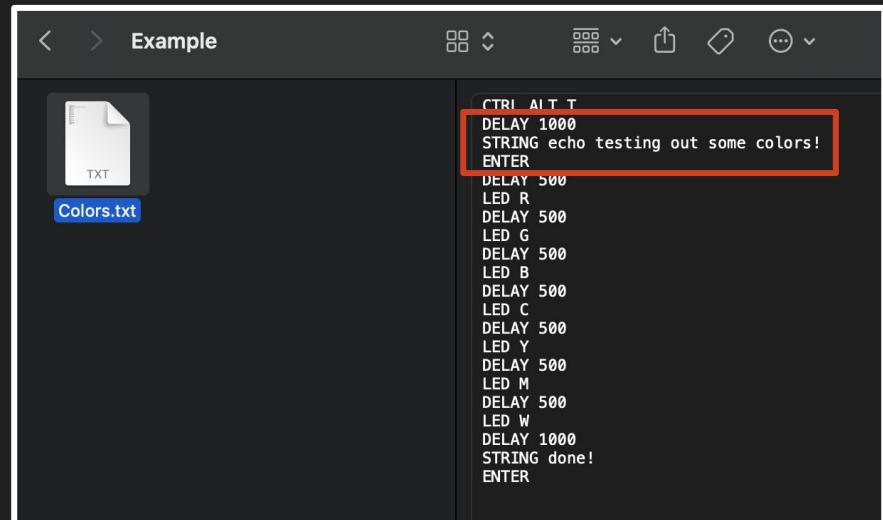

The USB Nugget has 4 MB of Flash storage!

1. Plug in your Nugget and open the **NUGGET** drive.
2. Use **folders** to organize your payloads
3. **Operating System → Category**  
→ **Payload.txt**

# Edit the Colors Payload

- Navigate to the **colors.txt** payload for your OS.
- Open it with your built-in text editor!
- **Change the output of the colors.txt string!**
- Save the file & run it!

The screenshot shows a terminal window titled "Example". On the left, there is a file icon labeled "Colors.txt". The main pane of the terminal displays the following text:

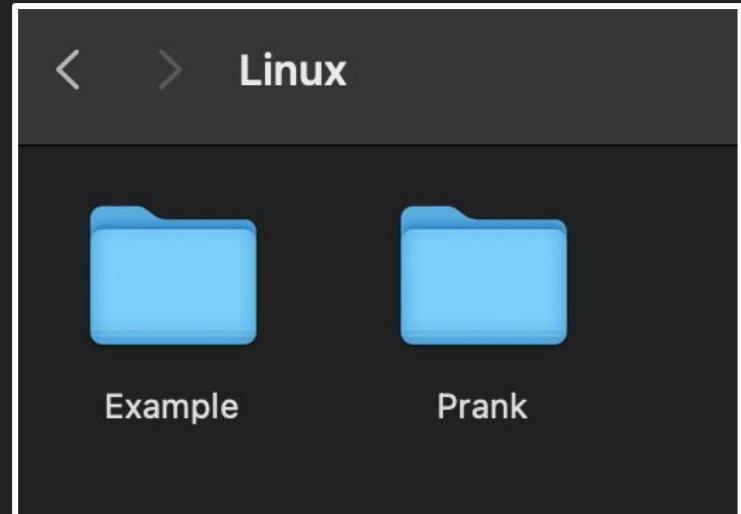

```
CTRL ALT T
DELAY 1000
STRING echo testing out some colors!
ENTER
DELAY 500
LED R
DELAY 500
LED G
DELAY 500
LED B
DELAY 500
LED C
DELAY 500
LED Y
DELAY 500
LED M
DELAY 500
LED W
DELAY 1000
STRING done!
ENTER
```

A red box highlights the first few lines of the text: "CTRL ALT T", "DELAY 1000", "STRING echo testing out some colors!", and "ENTER".

# Create a New Payload!

Suggested categories:

- Credentials
- Mobile
- Phishing
- **Prank**
- Exfiltration
- Prank
- Recon
- Remote Access

# Create Your First Payload

## 👉 **Tip: Work Backwards**

Let's write our first payload! We're going to create a classic RickRoll.

Payload Methodology:

1. **End Goal:** What will it do?
2. **Intermediate Steps:** What programs /commands need to run?
3. **Pseudo-Code:** Outline
4. **DuckyScript**

# Intermediate Steps

To execute the rickroll we need to:

1. Open a web browser
2. Open a Youtube video url
3. Turn up the volume!
4. Play video in full-screen

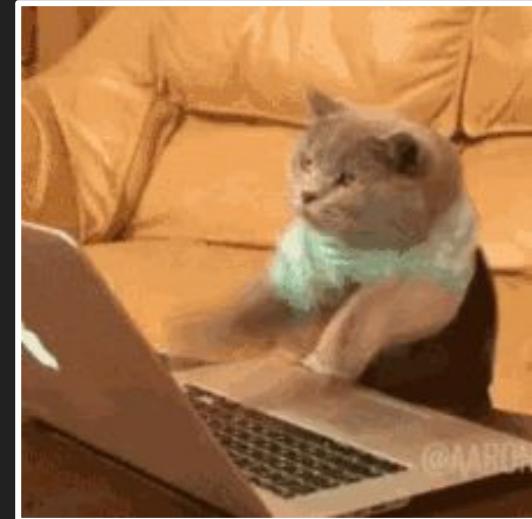

# PseudoCode

Let's take it a step further!

- Keyboard shortcuts
- Terminal commands
- Things to type
- Delays!

Delays are essential since the Nugget types extremely fast - and programs need time to open!

# Example PseudoCode

- Press a key combo to open a search dialogue
- Wait for it to open
- Type in chrome / firefox
- Press Enter
- Wait for browser to open
- Type in the url
- Press enter
- Wait for url to load
- Press a key for full screen

Finally, let's turn your pseudocode into actual DuckyScript!

## 👉 Tip: Delays and Timing

- Delays make one-way scripts possible.
- Because microcontrollers work so quickly, many of the commands would not work without adding time for commands to finish.
- In testing, we should start out with generous delays and gradually optimize them without breaking anything.

# Basic DuckyScript Commands

## Commands:

REM  
**STRING**  
**DELAY**  
DEFAULTDELAY  
LED

## Modifier Keys:

- CTRL or Control
- SHIFT
- ALT
- GUI

## Standard Keys:

- a-z
- A-Z
- 0-9
- F1-F12

## Key:

- ENTER
- MENU
- DELETE
- HOME
- INSERT
- UPARROW
- DOWNARROW
- LEFTARROW
- RIGHTARROW
- TAB
- END
- ESC
- SPACE
- PAUSE
- PRINTSCREEN
- CAPSLOCK
- NUMLOCK
- SCROLLLOCK
- PAGEUP
- PAGEDOWN

# 👉 Tip: HotKey Combos & Shortcuts

- Windows 10: <https://bit.ly/2nH8IWk>
- Linux (Debian): <https://bit.ly/3hKs5Nu>
- MacOS: <https://apple.co/3EfZGGK>
- Raspberry Pi OS: <https://bit.ly/3TE77x1>

# Intermediate Payloads

Get Started Creating Attack Payloads!

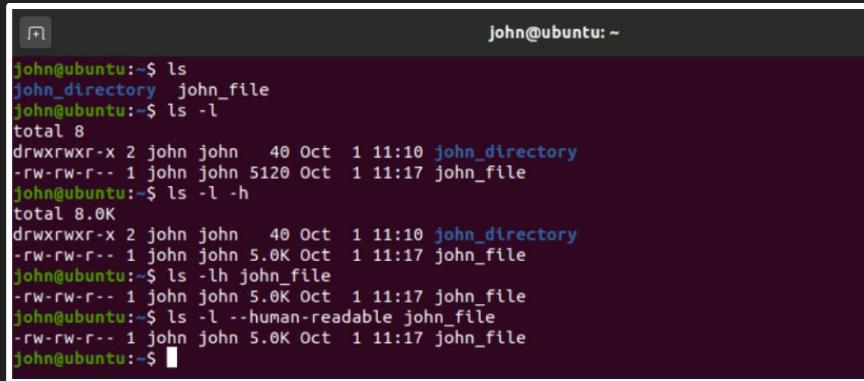

# **Payload 1: Command Line Exercise**

# 👉 Tip: Using the Command Line

The fastest way to do bad things on a computer is through terminal / powershell / command prompt.

You can:

- Create & modify files
- Open applications
- Run networking commands
- And more!

A screenshot of a terminal window titled 'Terminal' with the command line interface 'john@ubuntu: ~'. The window shows three ls commands being run:

```
john@ubuntu:~$ ls
john_directory john_file
john@ubuntu:~$ ls -l
total 8
drwxrwxr-x 2 john john 40 Oct 1 11:10 john_directory
-rw-rw-r-- 1 john john 5120 Oct 1 11:17 john_file
john@ubuntu:~$ ls -l -h
total 8.0K
drwxrwxr-x 2 john john 40 Oct 1 11:10 john_directory
-rw-rw-r-- 1 john john 5.0K Oct 1 11:17 john_file
john@ubuntu:~$ ls -l --human-readable john_file
-rw-rw-r-- 1 john john 5.0K Oct 1 11:17 john_file
john@ubuntu:~$
```

# 👉 Tip: Terminal Shortcuts

Quickest way to open a terminal on different operating systems.

**Linux:** CTRL ALT T

**Mac:**

- CTRL SPACE
- terminal
- ENTER

**Windows:**

- GUI R
- cmd
- ENTER

# Challenge: Dogecoin Ransom Message

Open a fake ransomware site in full screen  
using a terminal, and read a ransom message  
demanding crypto!

Hint:

- Use “say” or “espeak” commands
- Function keys can enable fullscreen
- <https://www.cryptoprank.com/#/crypto>

Bonus: Turn up the volume & lock the computer

# **Payload 2: Stagers & Remote Execution**

## Tip: Stagers

Using the DuckyScript payload as a stager lets us download external malware or executables!

<b>Manual</b>	Type out the whole damn script
<b>Storage</b>	Deploy locally from a flash drive - less can go wrong
<b>Remote</b>	Single command, dynamic payload

# Challenge: Bee Movie Attack

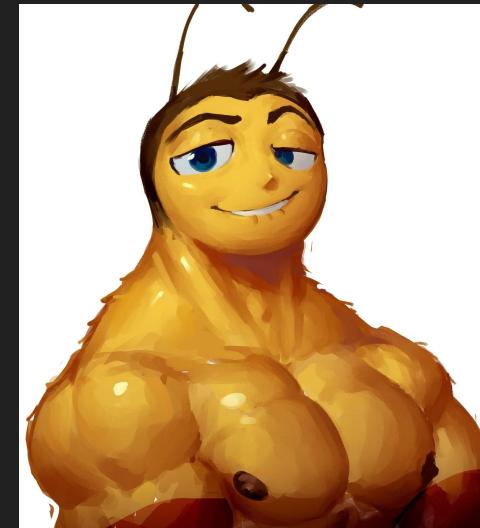

Download the entire bee movie script onto the victim's desktop as a text file!

## Hints:

- <https://bit.ly/3ZZEIL1>
- CLI tools like `curl` or `wget` can download urls

**Bonus:** Narrate the bee movie script and download 3 cursed pictures of Barry Benson to the victim's computer

## 👉 Tip: Web Interface

Let's set up the **web interface** to try a remote attack!

- Open the .usbnugget.conf file in a text editor
- Edit the network & password parameters!
- Do not add a space! :(
- Save, and restart your Nugget

# Access the Web Interface

The web interface allows you to run stored payloads or write new ones!

- Join the Wi-Fi Access point you set up on your Nugget!
- In a browser, navigate to:  
<http://192.168.4.1>
- Try running your payload from the web browser!

SELECT PAYLOAD

```

```
DELAY 1000  
GUI SPACE  
DELAY 100  
STRING terminal  
ENTER
```

SAVE FILE RUN LIVE

# **Payload 3: Data Exfiltration**

# 👉 Tip: Data Exfiltration

How can we exfiltrate data from a victim device?

- **Locally**
  - Physical access,
  - Quicker & less conspicuous
- **Remote**
  - Better for long term access
  - Creates web traffic

Let's try it locally first!

# Advanced Data Exfiltration: Side-Channel

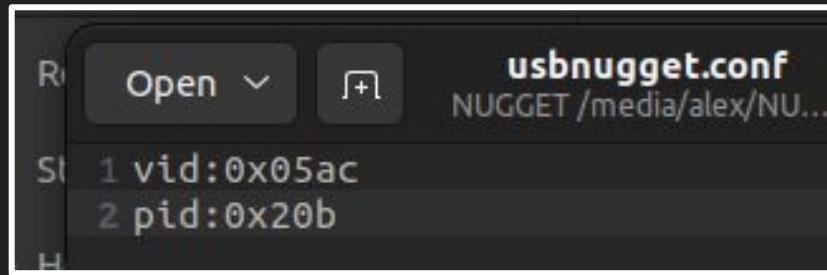

- Keyboards & HID devices have bi-lateral communication
- Computers can toggle CAPSLOCK or indicator keys
- We can use this to exfiltrate data in a protected environment by bitbang data via binary

## 👉 Tip: HID Emulation

We can emulate common USB / HID vendors!

- Open the .usbnugget.conf file
- By default, we emulate an Apple Keyboard to prevent MacOS systems from flagging the Nugget
- USB vendor list:  
<http://www.linux-usb.org/usb.ids>
- Try changing the VID/PID, and reset your Nugget for the change to take effect!

VID: Vendor ID

PID: Product ID

# Real Life Scenario: Razer Admin Exploit

A Razer Synapse bug lets you get Windows admin privileges by plugging in a Razer mouse or keyboard.

[https://www.bleepingcomputer.com/  
news/security/razer-bug-lets-you-bec  
ome-a-windows-10-admin-by-pluggin  
g-in-a-mouse/](https://www.bleepingcomputer.com/news/security/razer-bug-lets-you-become-a-windows-10-admin-by-plugging-in-a-mouse/)

# Challenge: Data Exfiltration

Steal a file containing secret credentials from the Raspberry Pi and emulate a Logitech device!

Hint:

- VID / PID list: <http://www.linux-usb.org/usb.ids>
- .txt file located at ~/Pi/Documents/creds.txt
- Flash drive mounts at ~/media
- Linux commands: cd, cp

Bonus:

- Steal other .txt files and images from the home directory!
- Save network info or filesystem info as a text file

# Payload Challenge

# CTF: Design the Highest Scoring Payload

In our last section, we'll be working together to write payloads to win a prize!

- Our target is a Raspberry Pi computer running Linux (Raspbian).
- Your goal is to make a payload that causes the most amount of mischief!

# Example Actions

- Steal a file
- Delete a file
- Write a file with a message in it
- Steal a hash
- Corrupt a hash
- Kill the computer
- Plant a keylogger
- Rickroll
- Join rogue Wi-Fi network
- Team ASCII banner
- Grabify link tracker
- Cron task
- Netcat backdoor
- Change background
- Auto-restart computer
- Auto-quit programs

# Attack Criteria

For our final challenge, we'll be dividing into teams and working on HID attack scripts to achieve a number of specific goals.

Each team will get time to write their script, and then 90 seconds to plug in and run their script.

The team to earn the most number of points wins a prize! Points are awarded when a team achieves the actions below:

Points	File Operations	Flags	Destruction	Advanced (x 2 points)
10	Create a text file with a message	Display a message demanding bitcoins	Reboot or shut down the computer	Create a Cron Task
20	Delete a file	Change the Wallpaper	Kill the network connection	Download & execute a bash or Python file
30	Download a file to the desktop	Get a Grabify link hit from the target computer	Kill the computer (No boot)	Steal data via Grabify
40	Create a fork bomb	RickRoll in a browser window	Create startup task that shuts down computer	Join an (evil) Wi-Fi network
50	Steal a file off the computer	Change RPI's SSH MOTD Banner to your team name	Encrypt files or the file system (ransomware)	Netcat backdoor (remote access)

# Taking it Further

# Mitigation

- Don't plug in random devices into your computer.
- Whitelisting / Blacklisting USB Devices
- USBDGuard or other keystroke injection detection tools can look for fast keystrokes

The screenshot shows the official website for USBDGuard. At the top, there is a navigation bar with links for HOME, BLOG, DOCUMENTATION, CONTRIBUTE, and COMMUNITY. To the right of the navigation bar are icons for GitHub and RSS feed. The main header features a blue shield logo with a white 'G' and the text "USBDGuard" in a large, bold, dark font. Below the header, a brief description states: "The USBDGuard software framework helps to protect your computer against rogue USB devices (a.k.a. BadUSB) by implementing basic whitelisting and blacklisting capabilities based on device attributes." A "Features" section lists several bullet points: "Rule language for writing USB device authorization policies", "Daemon component with an IPC interface for dynamic interaction and policy enforcement", "Command line and GUI interface to interact with a running USBDGuard instance", and "C++ API for interacting with the daemon component implemented in a shared library". Another section, "Supported Operating Systems", notes that USBDGuard currently works only on Linux and provides a link to a document for more information. On the right side of the page, there are two columns: "Latest Release" (with a link to "usbdguard-1.0.0") and "Quick Links" (with links to "Releases", "Report a bug", and "Request a feature"). A "Recent Posts" sidebar on the far right lists several recent releases and project enhancements.

# GeoFence Attacks

GeoFence attacks can determine if specific people are nearby, by looking for the presence of their laptop / cell phone.

This can be done by looking for known WiFi or BlueTooth devices.

# Mobile Attacks

Mobile phones (iOS and Android) also support HID keyboards!

Check out mobile payloads here:

<https://github.com/hak5/usbrubberducky-payloads/tree/master/payloads/library/mobile>

Android Hacking with  
the USB Rubber Ducky

# Other USB Attacks: Ethernet

- This Bash Bunny payload emulates a USB-ethernet adapter, and pretends to be the network gateway.
- This allows it to intercept network traffic.
- Works on locked computers

<https://shop.hak5.org/blogs/bash-bunny/network-hijack-attacks-with-the-bash-bunny>

# Thanks for coming!
